

The Internet Defense Company

Helping businesses find vulnerabilities.

Our Services

Essential Vulnerability Scan

Essential Vulnerability Scan provides a rapid yet thorough assessment of your systems and web applications to identify known security weaknesses. Using industry-standard tools and manual verification, we detect outdated software, misconfigurations, exposed services, and high-risk vulnerabilities that attackers commonly exploit. The goal is to give you a clear security baseline and actionable insights for immediate improvement. This is one of the most recommended starting points for any organization, as it establishes a clear security baseline and highlights immediate areas for improvement.

Penetration Testing

Penetration Testing service simulates real-world cyberattacks to evaluate how well your infrastructure stands against threat actors. We follow structured methodologies to uncover exploitable vulnerabilities, privilege-escalation paths, and potential data-exposure risks. This assessment goes beyond automated scanning by applying manual, attacker-like techniques to help organizations strengthen their security before a real breach occurs. Penetration testing remains one of the most crucial and in-demand services, as it provides organizations with a realistic understanding of how attackers could breach their systems.

Network Security Audit

Our Network Security Audit examines your routers, switches, firewalls, and network topology to ensure your internal environment is configured securely. We assess access control, segmentation, device hardening, and protocol usage to identify weaknesses that could allow lateral movement or unauthorized access. The audit helps reinforce your network's foundation and ensures every connected device adheres to best-practice security standards.

Wi-Fi Security Assessment

This assessment focuses on your wireless infrastructure—an often overlooked entry point for attackers. We evaluate your Wi-Fi encryption, authentication methods, access policies, guest networks, and device separation. By identifying weak configurations or insecure access points, we help ensure your wireless environment is protected against unauthorized access and modern attack techniques.

Phishing Campaign

Our Phishing Campaign service measures your team's awareness and resilience against social engineering attacks. We design realistic email simulations to observe how employees respond to suspicious messages. The results help uncover training gaps, and organizations can optionally include awareness sessions to strengthen staff preparedness and reduce human-factor risks.

Dark Web Campaign

The Dark Web Campaign scans underground forums, marketplaces, and leak databases for compromised credentials, company mentions, or exposed information. Early detection of breached data allows organizations to take corrective steps before attackers exploit it. This service provides visibility into risks that traditional security tools cannot detect.

Password Hygiene Review

Weak or reused passwords remain one of the most common causes of breaches. Our Password Hygiene Review analyzes your organization's password policies, authentication methods, and potential reuse issues across platforms. We provide clear recommendations to strengthen credential practices and reduce the chances of account compromise.

Custom Security Policies

Every organization has unique operational needs—our Custom Security Policies service designs tailored security standards that align with your business goals. Whether you require policies for access control, network usage, or data protection, we ensure they are practical, enforceable, and aligned with best security practices.

Social Media and Brand Protection

This service safeguards your brand's online presence by monitoring platforms for impersonation, unauthorized pages, malicious impersonators, and leaked information. We help prevent reputation damage and protect your customers by identifying and reporting harmful content before it spreads.

Service Packages

Package	Included Services	Price
Starter Security Pack	Essential Vulnerability Scan Password Hygiene Review + Basic Security Report	Starting from ₹5,000
Growth Security Pack	Everything in Starter Pack, Phishing Campaign & Awareness Training, Dark Web Campaign + Reports	Starting from ₹11,000
Premium Defense Pack	Everything in Growth Pack, Custom Security Policies, Brand Protection + Executive Summary Reports	Starting from ₹18,000
Wi-Fi and Network Pack	Wi-Fi Configuration Review, Network Device Discovery, Router & Firewall Configuration Audit, Guest Network Isolation Test, Access Control & Device Segmentation Check + Detailed Reports	Starting from ₹8,000
Basic Penetration Testing Pack	Includes Wi-Fi & Network Pack, Penetration testing, Password Hygiene Review + Comprehensive Findings & Remediation Report	Starting from ₹15,000

***Individual services can be performed on a custom price basis**

Note:

- All prices listed above are baseline estimates for standard engagements
- Final pricing may vary based on the scope, size, and complexity of the environment
- Discounts available for annual contracts and multiple engagements
- All packages includes one remediation consultation session

Why Choose IDC?

- **Thorough Testing, Done Properly**
Every assessment — from vulnerability scans to penetration tests — is performed with careful manual verification to ensure accurate and meaningful results.
- **Reports which you can Actually Use**
Each report is presented clearly, with prioritized risks and practical, environment-specific fixes that clients can apply without confusion.
- **Affordable, Practical Security**
Our services are tailored for businesses that need dependable security assessments without enterprise-level pricing.
- **Flexible Engagements**
Whether your business needs a quick scan, a detailed pentest, a network audit, or brand exposure checks, the services can be adapted to fit the specific environment and requirements.
